

Cloud Architecture Outline

User sends request → Internet → Load Balancer → Firewall →
Web Server → Application Server → Database.

Architecture Components

• **Objective**

- The objective is to design a simple and secure cloud architecture for a web application.
- Architecture Components
 - User – The user accesses the web application through the internet.
 - Internet – Provides connectivity between the user and the cloud application.
 - Load Balancer – Distributes incoming requests across available servers.
 - Firewall / Security Group – Controls network traffic and protects the application from unauthorized access.
 - Web Server – Receives and handles web requests from users.
 - Application Server – Processes the business logic of the application.
 - Database – Stores application data securely.
